

Buddy Williams

Forward Deployed Engineer

Atlanta, GA · 678-697-5188 · buddywilliams@gmail.com buddy-williams.com · linkedin.com/in/buddylwilliams · github.com/buwilliams

I search for good explanations and build inspiring things.

SUMMARY

Engineer and end-to-end operator with 20+ years shipping production software, including two modernization engagements delivered directly for **Insurity — Sure Commercial (2024) and ClaimsXPress (2026), the latter being integrated into the Pro Suite platform**. I own the full arc: discovery, architecture, integration against legacy systems and data, hands-on development, production deployment, and the troubleshooting that follows. The 2026 CXP engagement runs on Refine, my open-source agentic delivery system, which let a team of two cover work that took five a year earlier. Daily GenAI engineering practice — Claude Code, Cursor, Copilot — plus shipped LLM systems using retrieval, agent orchestration, and verifier-based correctness checking.

INSURITY PLATFORM EXPERIENCE

Two product modernization engagements delivered for Insurity as project lead at Nevo Technologies.

- **ClaimsXPress (CXP) modernization and Pro Suite integration — 2026, team of 2.** Currently leading modernization of the CXP claims platform and its integration into Pro Suite. Insurity adopted Refine, my open-source agentic delivery system, as the delivery vehicle. Architecture spans FNOL intake, coverage verification, claim assignment and routing, financial processing and reserves, subrogation, document management, and a configurable rules engine, alongside SSO, audit logging, and regulatory integrations.
- **Cost outcome.** AI-assisted delivery on Refine cut the team from five to two against comparable scope, sharply reducing engagement cost relative to the 2024 program — the same economics this role is built to deliver at customer sites.
- **Sure Commercial modernization — 2024, team of 5, one year.** Led the year-long modernization of Insurity's Sure Commercial product: architecture, technical direction, developer leadership, hands-on build, and delivery accountability to Insurity stakeholders throughout.

I already work inside this product surface. I know where CXP, Pro Suite, and Sure Commercial bend, where the integration work concentrates, and how fast a small AI-assisted team can move through it.

EXPERIENCE

Chief AI Innovation Officer, Nevo Technologies

Mar 2025 to Present · Atlanta, GA (Remote)

Three roles held concurrently at a custom software and modernization firm serving insurance, healthcare, staffing, and logistics.

- **Delivery.** End-to-end ownership once a deal closes: architecture, project planning, client relations, development leadership, hands-on coding, and production deployment. The Insurity engagements sit here and in the prior role.
- **Applied AI engineering.** Shipped production LLM systems and AI-assisted development tooling used on live customer engagements — spec-driven agent execution, deterministic retrieval, and independent verifier agents that re-check generated work before it lands.
- **Sales and scoping.** Sourcing through close, so requirements arrive from conversations I was in rather than a handoff document.

Principal and Account Executive, Nevo Technologies

Aug 2021 to Mar 2025 · Atlanta, GA (Remote)

- Owned enterprise modernization delivery end to end — discovery, architecture, integration design, delivery leadership, and go-live — across insurance, logistics, and healthcare, including multi-million-dollar contracts.
- Built APIs, data pipelines, and migration tooling between modern platforms and legacy carrier systems, including the structured and semi-structured data transformation these cutovers depend on.
- Ran customer-facing troubleshooting and production issue resolution across distributed systems, databases, and third-party integrations.
- Closed more than \$2.3M in engagements over four years while remaining hands-on in the codebase.

Technical Lead, Workstorm

Mar 2018 to Mar 2021 · Remote

- Led build-out of the UI platform across desktop, mobile, and web for a privacy- and security-focused enterprise collaboration product, including a shared component architecture across all three targets.

Lead Software Developer, Markel Corporation

Mar 2011 to Aug 2013 · Kennesaw, GA

- Lead developer on insurance application, rating, and policy management systems for a specialty P&C carrier, using data-driven design so product and rating changes were configuration rather than code rewrites.

Earlier Roles

Senior/Lead Software Developer at PostHog, Outpace, Datatrac, Devnext, WebMD, and Turner Broadcasting — analytics platforms, shipping logistics, donation management, advertising and A/B testing, member and security services. Co-founder and Lead Developer at PhyQuest (radiology follow-up and risk reduction). Founder, Buddy Lee Technology LLC (seed-funded low-code application platform).

RELEVANT PROJECTS

Refine — agentic software delivery system (2026)

Open-source management layer over a fleet of coding agents, orchestrating work across distributed repositories, branches, and nodes, with governance that keeps agent output aligned to product intent before it merges. Rust; installable via CLI or by a coding agent. **Adopted by Insurity for the CXP modernization.** github.com/buwilliams/refine

Forge — agentic delivery tooling (2026)

Claude Code plugin for spec-driven agentic development. Decomposes goals into tasks, launches role-specific subagents with exactly the context each needs, and runs every task through an implement/verify/commit loop with the filesystem as the state machine. An independently generated verifier agent re-checks completed work before it is accepted. github.com/buwilliams/forge

Corpus Council — grounded LLM application (2026)

Python API and CLI routing every response through markdown-defined personas with authority tiers. Retrieval is deterministic — embeddings plus cosine similarity in ChromaDB, top-K injected into every prompt rather than LLM-selected — so answers are grounded in a known context. Anthropic API, sentence-transformers, YAML config. github.com/buwilliams/corpus-council

T-SQL to Spark SQL conversion tool with executing verifier

AI-first migration utility built for an enterprise prospect: a pending/review/approve workflow over AI-converted SQL, plus a PySpark verifier that executes converted queries against loaded synthetic data, so correctness is checked end to end rather than syntactically. Generalizes directly to carrier data-migration work. Walkthrough

TECHNICAL SKILLS

- **GenAI tooling and LLM patterns.** Claude Code (daily driver, plugin author), Cursor, GitHub Copilot, OpenAI Codex; multi-model orchestration across Anthropic and OpenAI APIs. RAG and deterministic retrieval, embeddings and vector stores (ChromaDB, sentence-transformers), agent and subagent orchestration, tool use, structured output, verifier-based correctness checking, prompt and context engineering.
- **Languages.** Python, JavaScript/TypeScript, C#/NET, SQL (T-SQL, PostgreSQL), Go, Java exposure.
- **Data and integration.** SQL and data transformation over structured and semi-structured sources, ETL and migration pipelines, Spark SQL, data modeling, REST API design and consumption, legacy and third-party system integration, Node/Express and FastAPI-style services.
- **Cloud and delivery.** AWS and Azure, Docker, CI/CD, Git, infrastructure-as-code exposure, production monitoring and incident triage.
- **Insurance domain.** Policy administration, rating, billing, claims intake and adjudication, P&C and specialty lines, carrier data migration, regulated-environment delivery.
- **Additional.** Self-taught engineer, with equivalent work experience well beyond the bachelor's-level requirement. Based in Atlanta, GA; open to remote and hybrid work and to frequent domestic and international travel.
